

Starting a map in leaflet

Starting a map in leaflet

How much context does your map need?

{leaflet} map tiles

`{leaflet}` has a much wider array of map tiles available than `{ggspatial}`.

You can obtain the names of all the map tiles from `leaflet::providers`

[This website](#) allows you to compare the map tiles.

{leaflet} background color

The `{leaflet.extras}` package add lots of additional functionality to `{leaflet}` - including setting a background color.

```
leaflet_map %>%  
  setMapWidgetStyle(list(background= "lightblue"))
```

Using columns in {leaflet}

In {ggplot2} we used `aes()` to create mappings between our data and the chart.

In {leaflet} we use `~column_name`
